

Passerelle framework, from ISENCIA company, is a toolkit for designing data workflows in a “drag and drop” graphical environment. Its core functionalities are based on the Java technology standards. It allows people with no programming skill to easily define their own sequences.

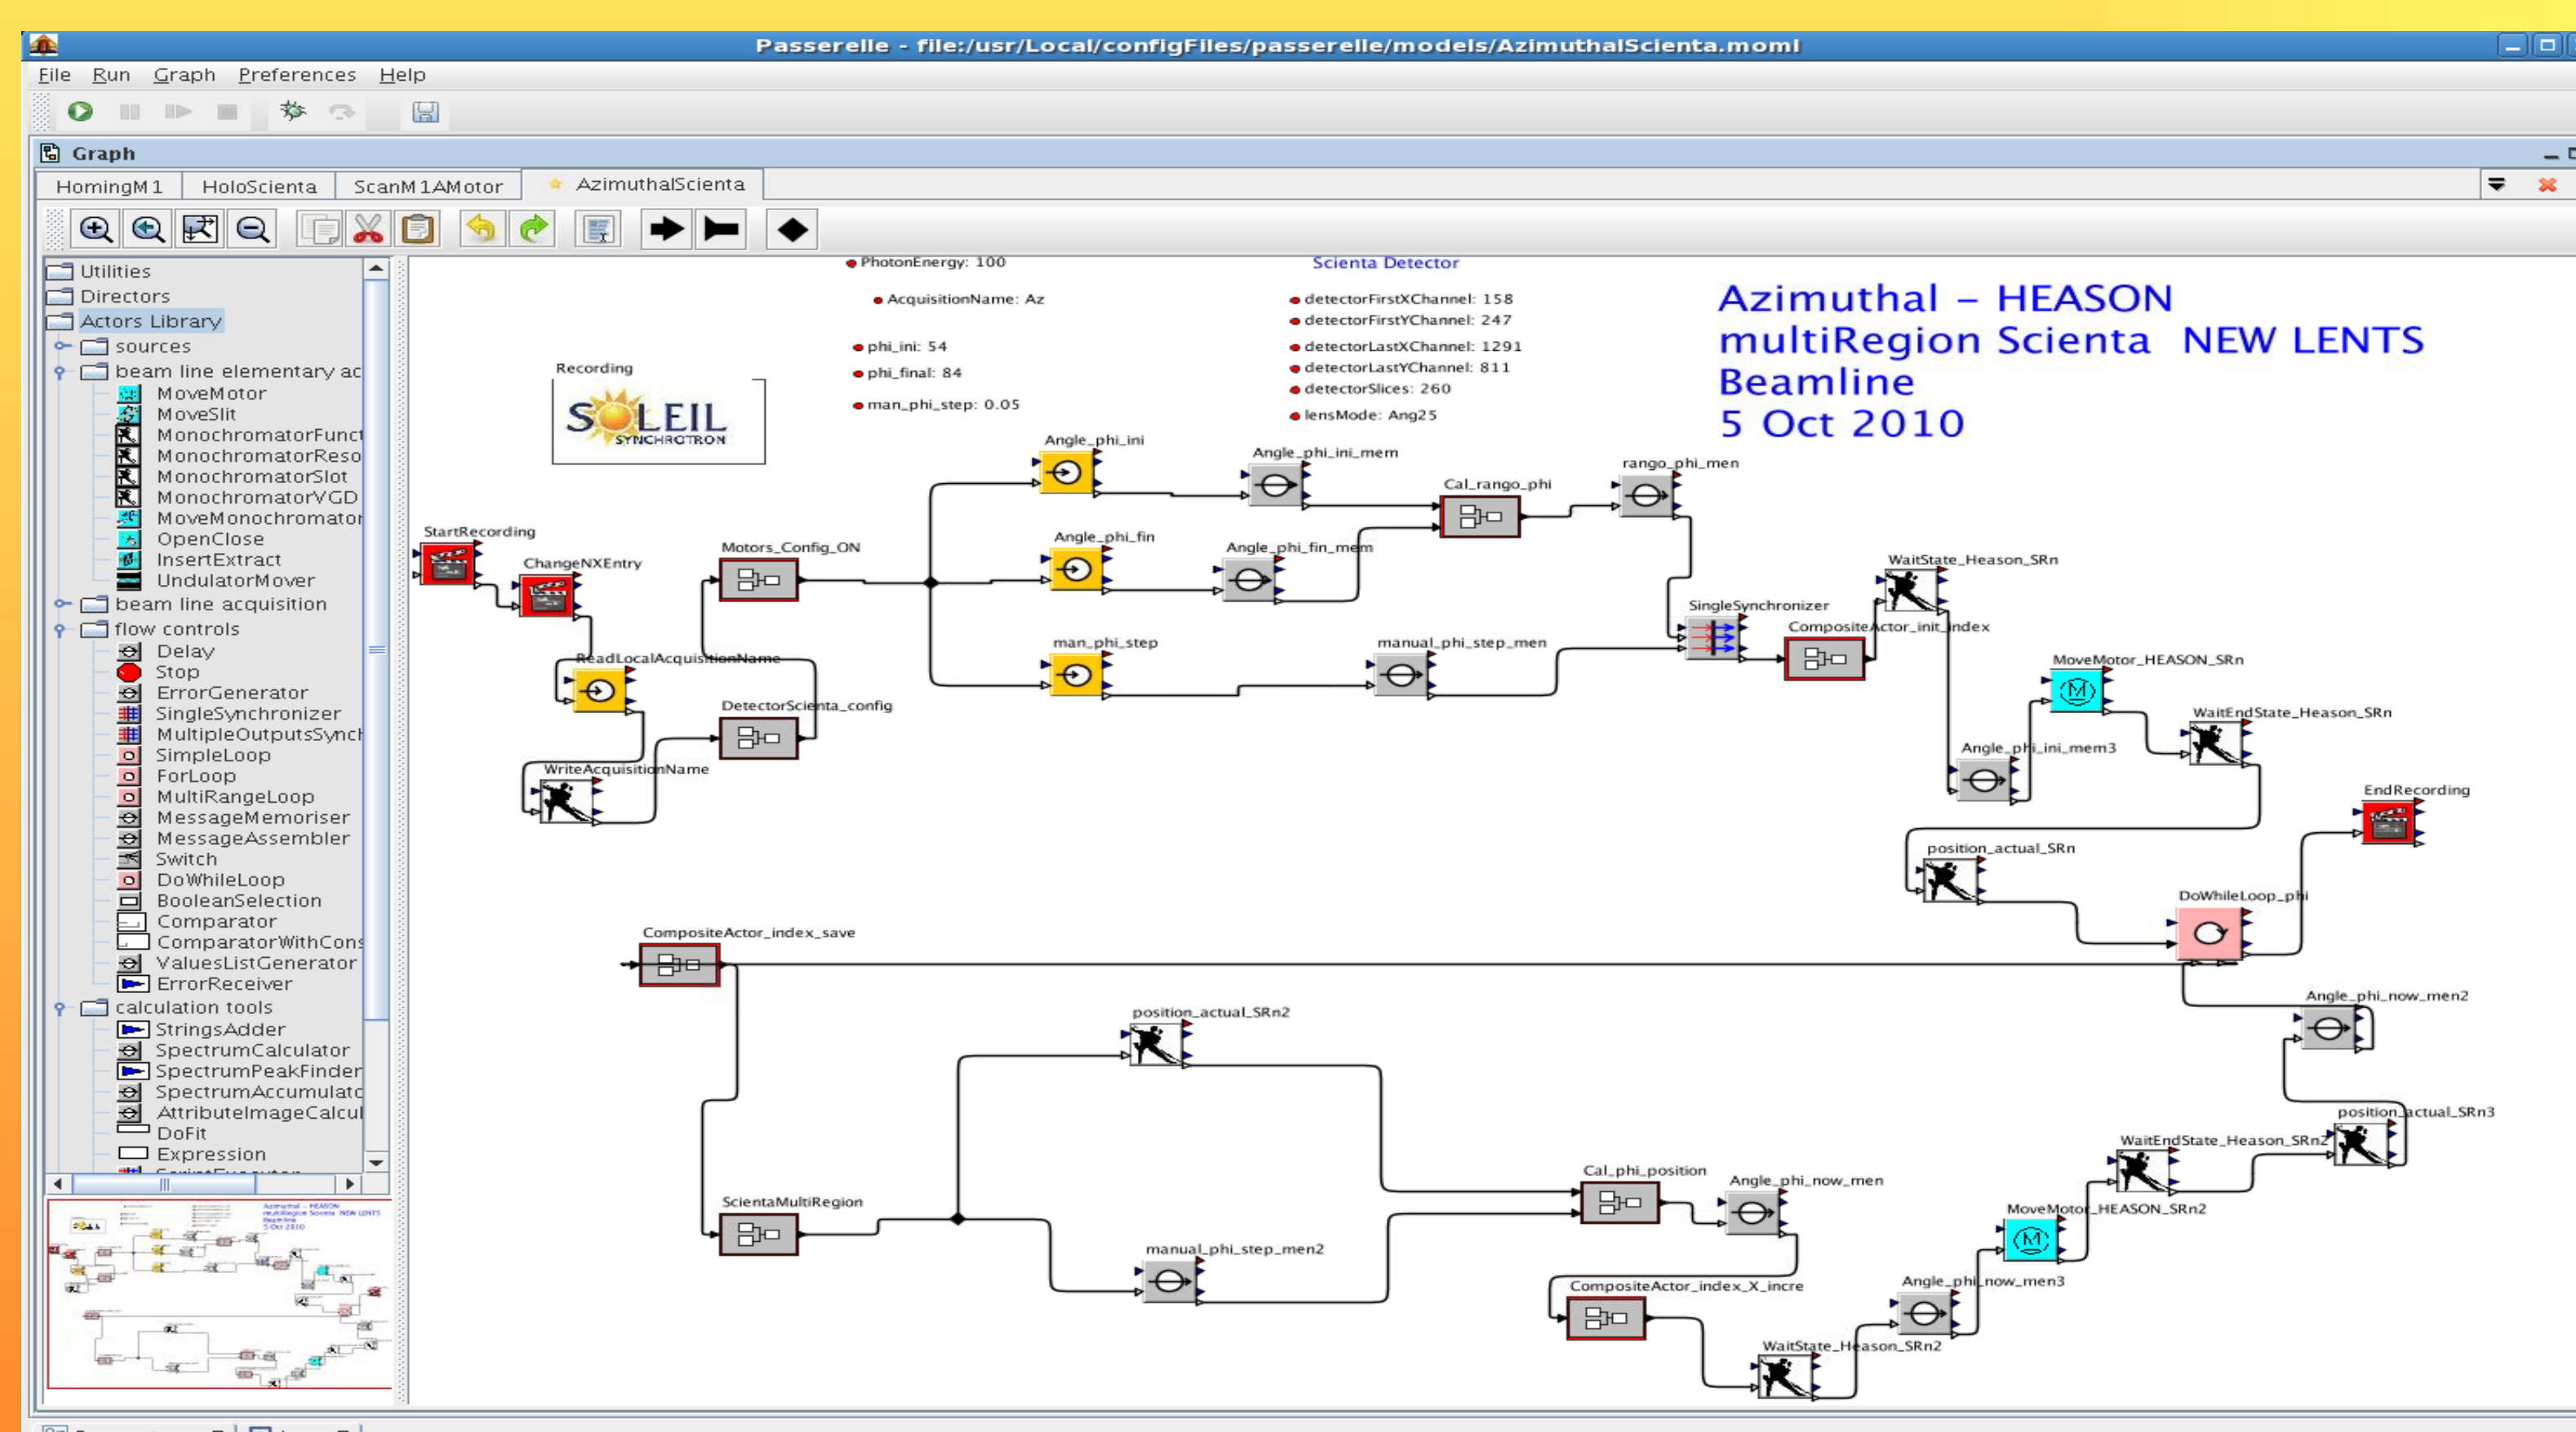

Concepts

- **Actor**: execute an action
- **Message**: transfer data between actors
- A sequence is called a **Model**.

A very simple model that calculates the sine function of a value and writes the result to a file

Execution Environment

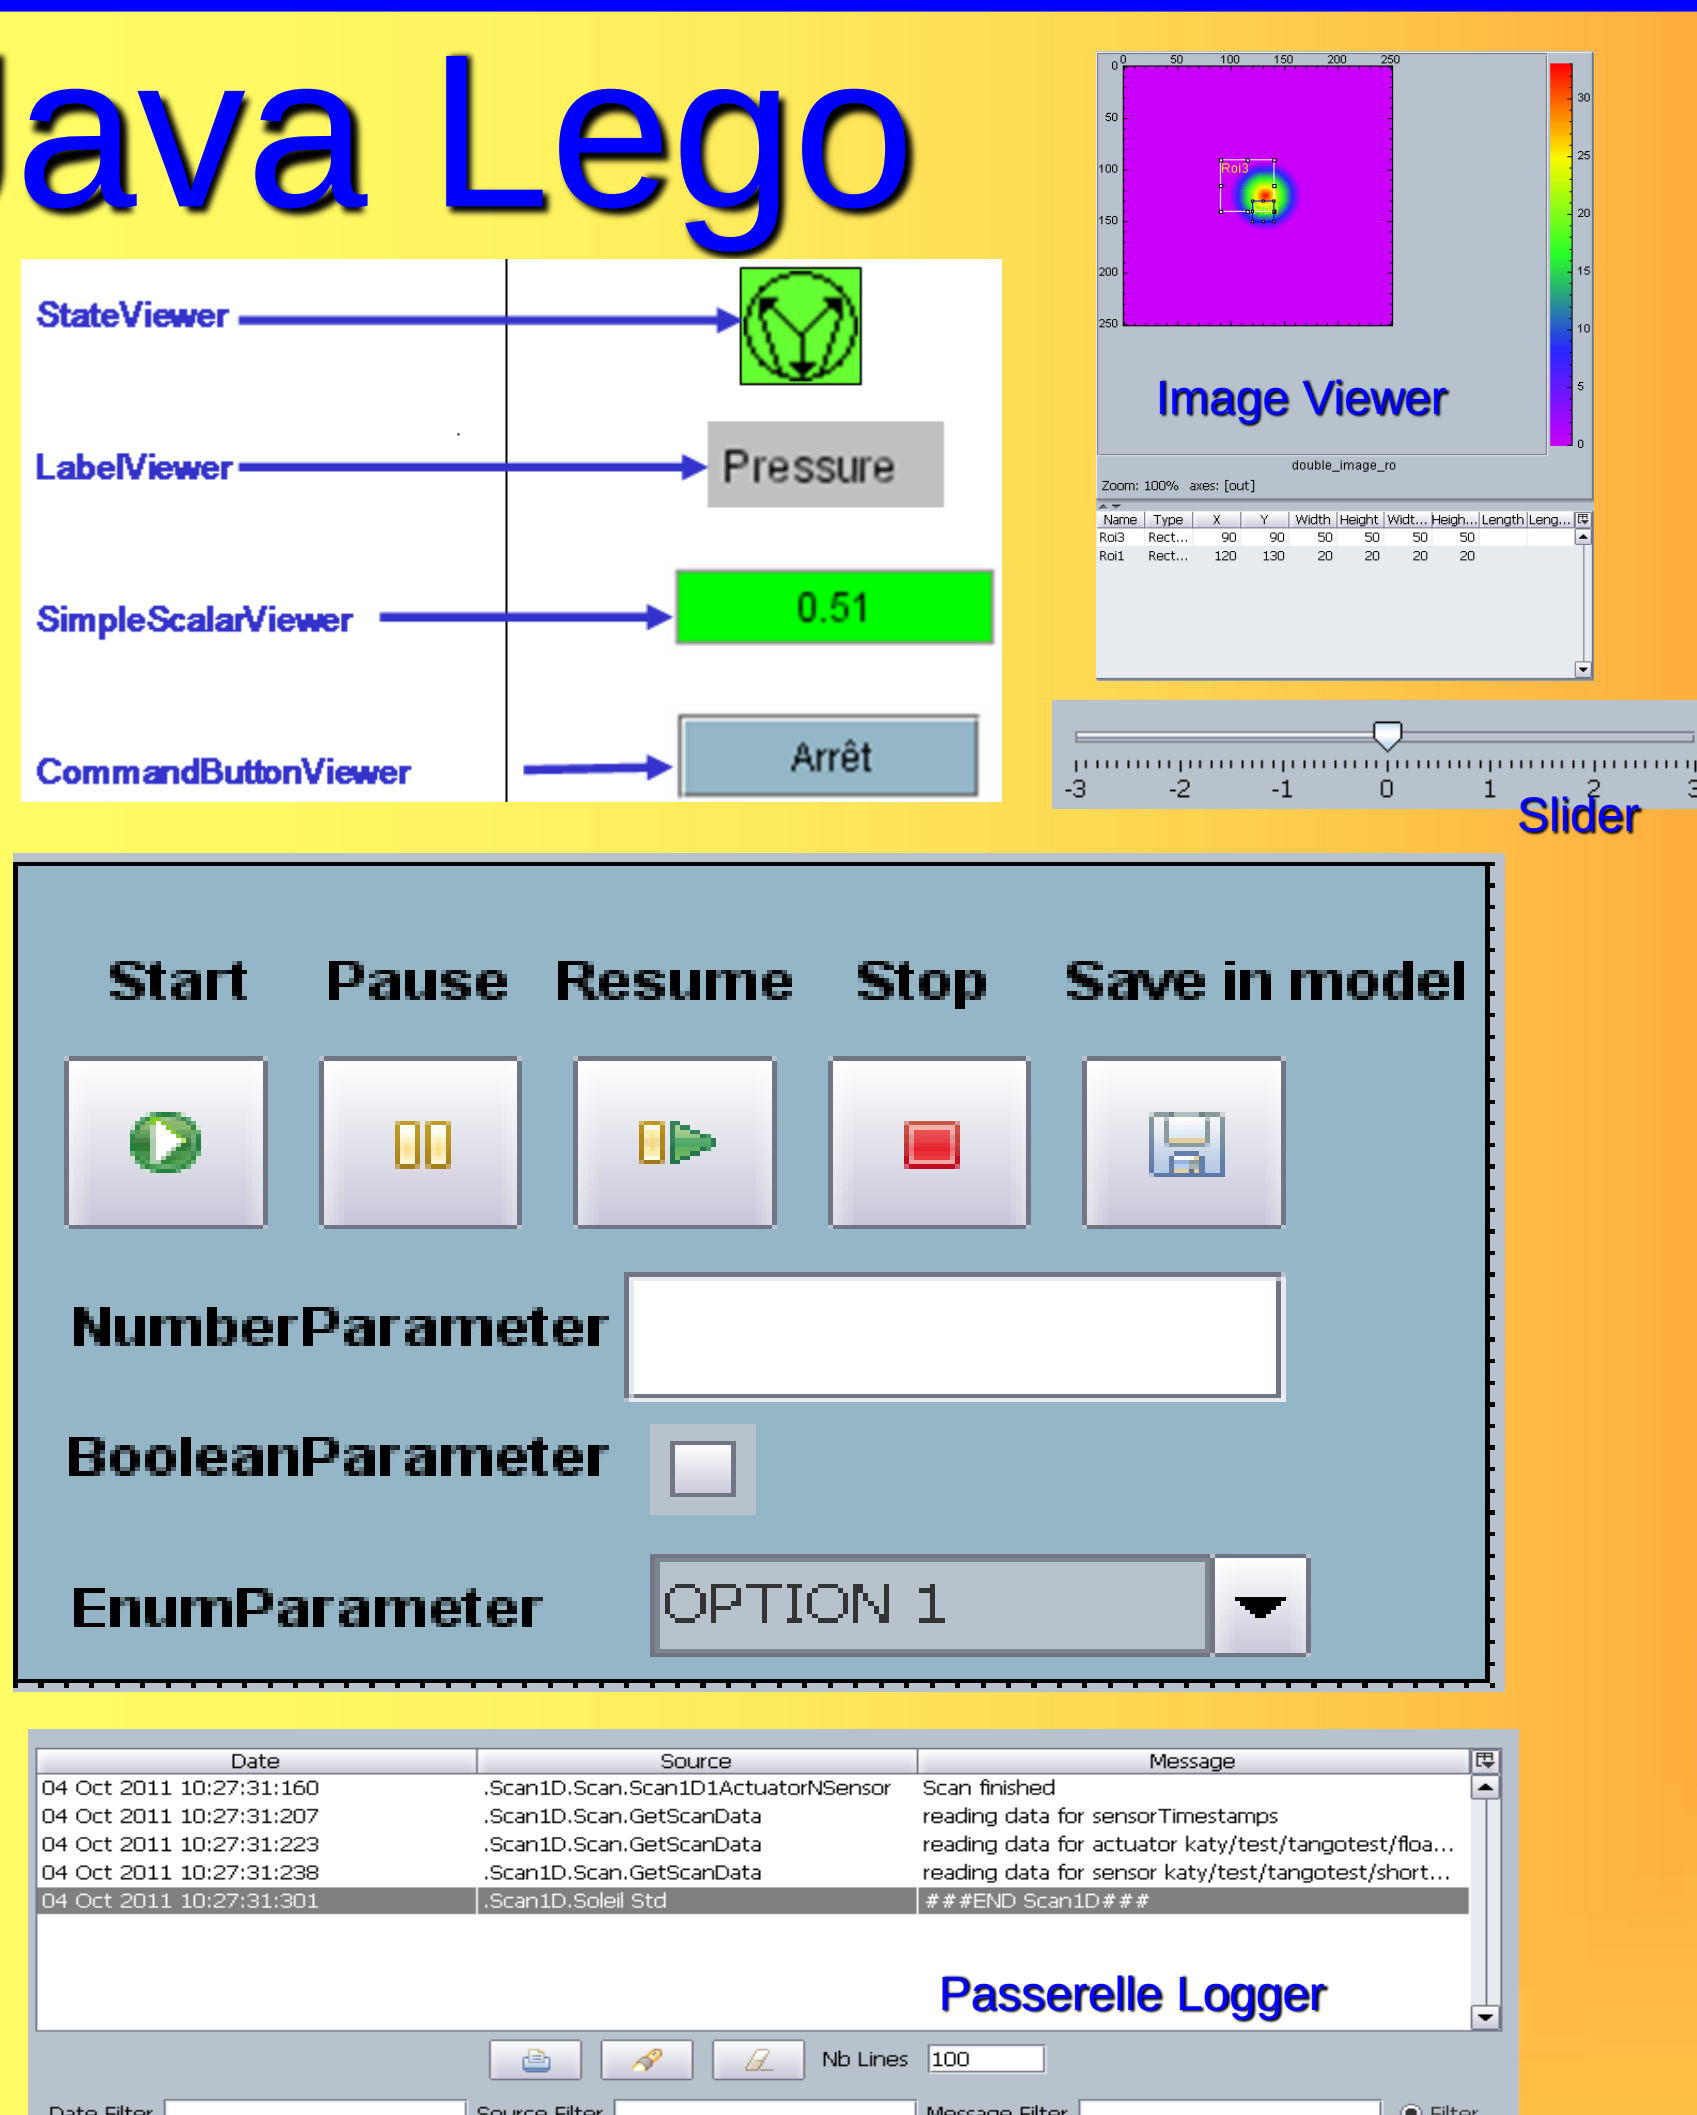

The Passerelle's IDE, used by beamlines team, supports the design, definition and testing of models. On the right part a set of predefined actors.

Computer team provides unitary components based on COMETE library. PasserelleWidget library is also provided with Java components upper the workflow engine.

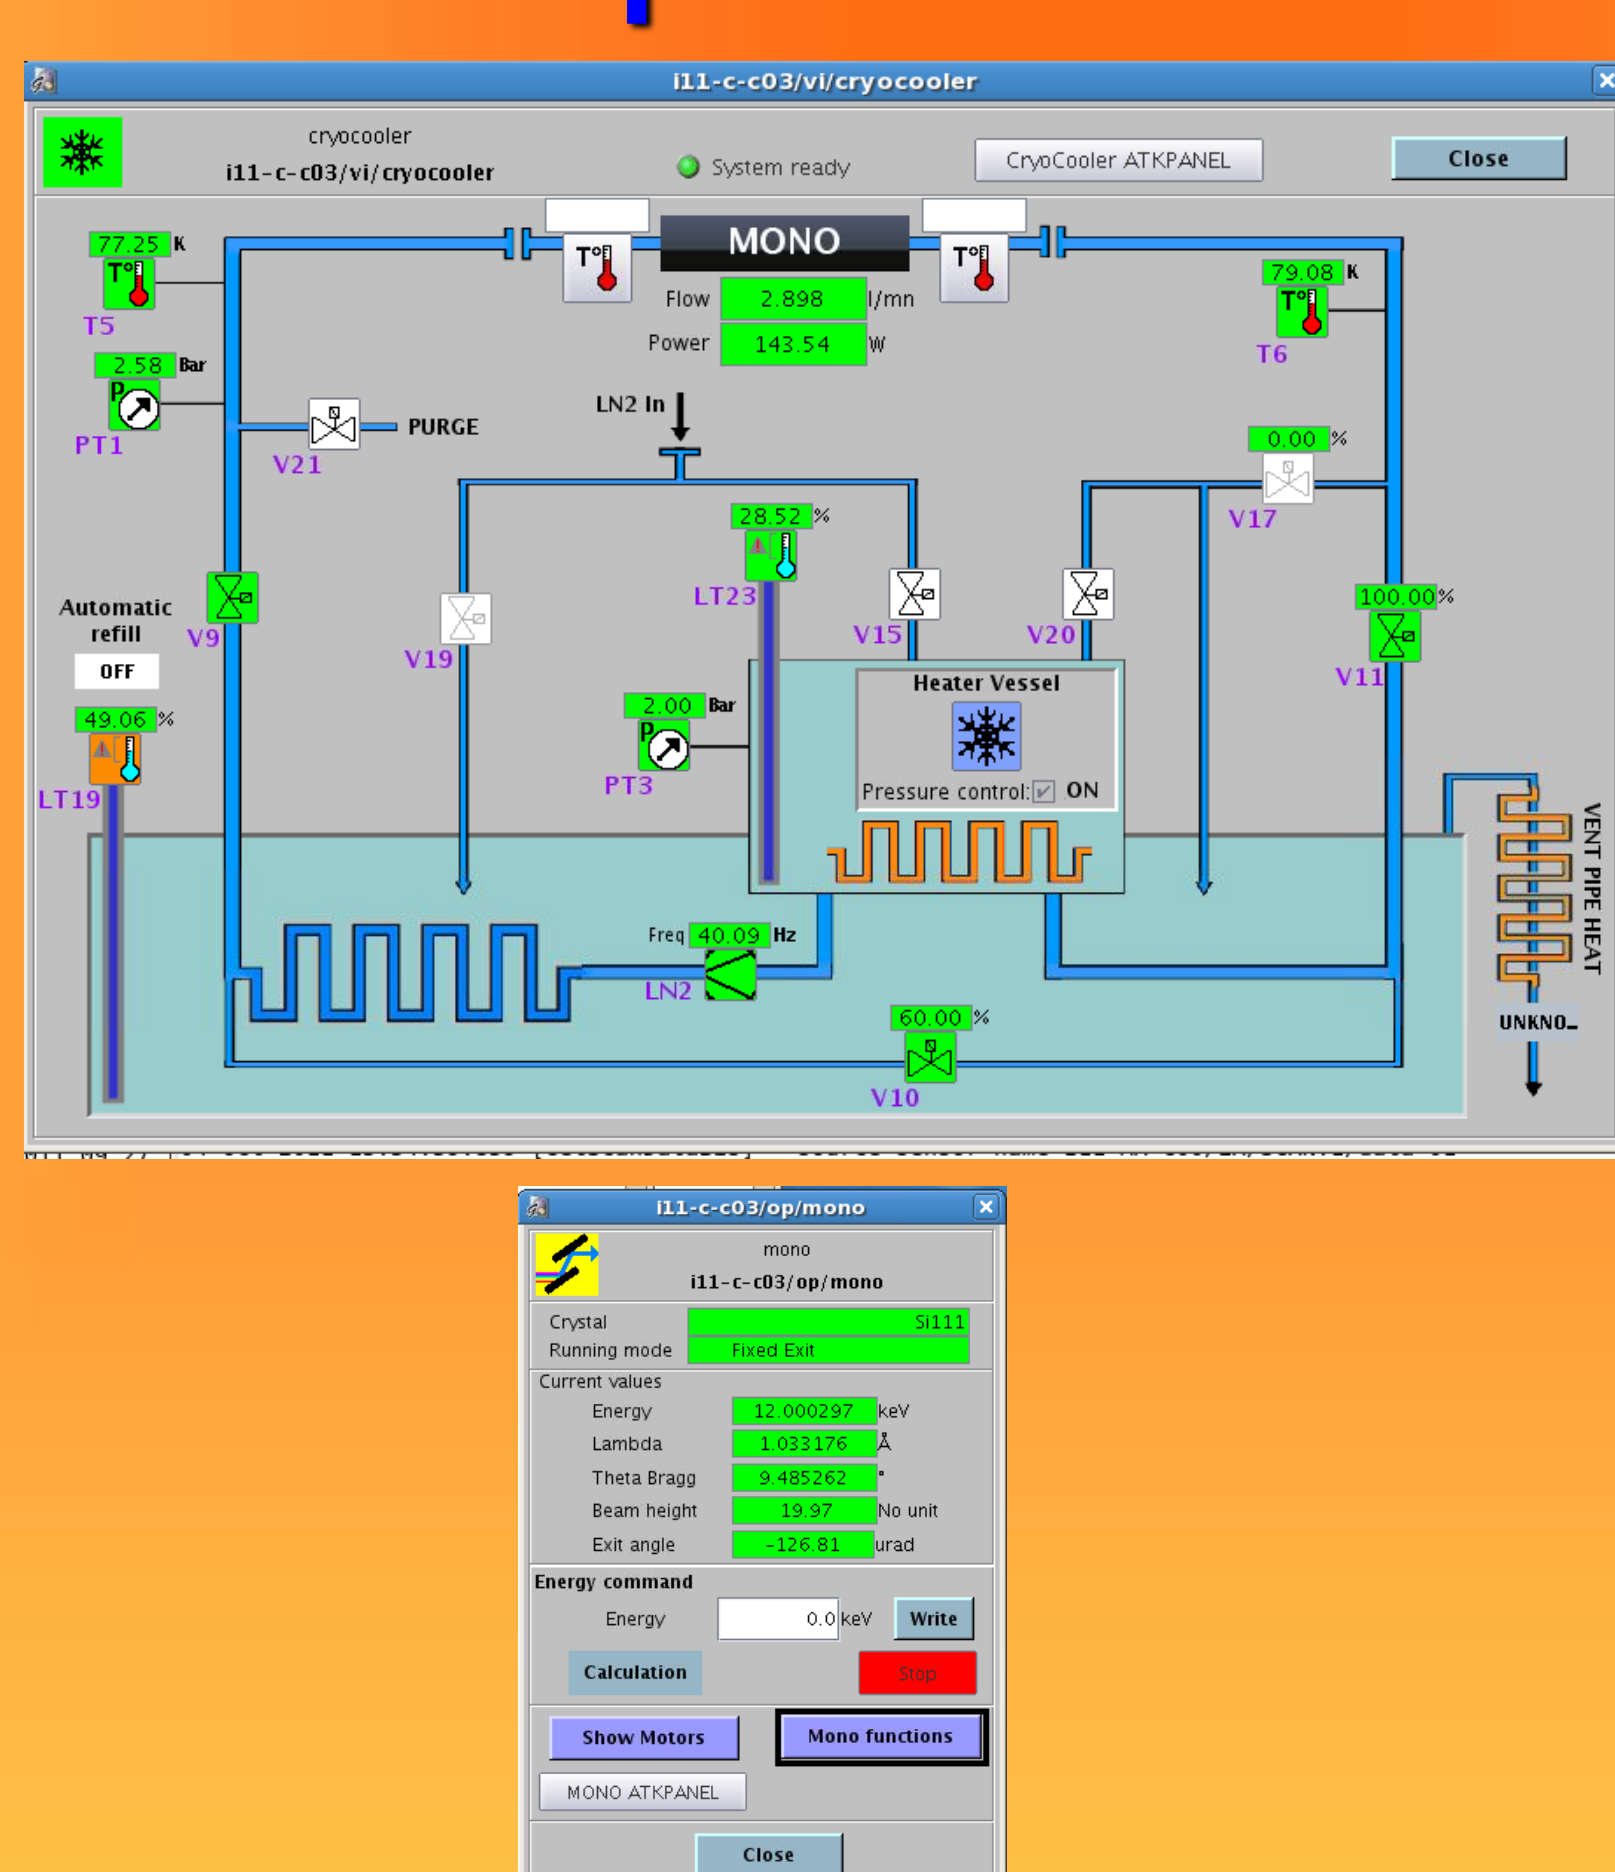

From these Java brick, advanced users built libraries of accelerators and beamlines functional components. There are included in an industrial Java Scada named GlobalScreen.

GlobalScreen tool allows machine and beamlines peoples, building their own Supervision and Acquisition application.

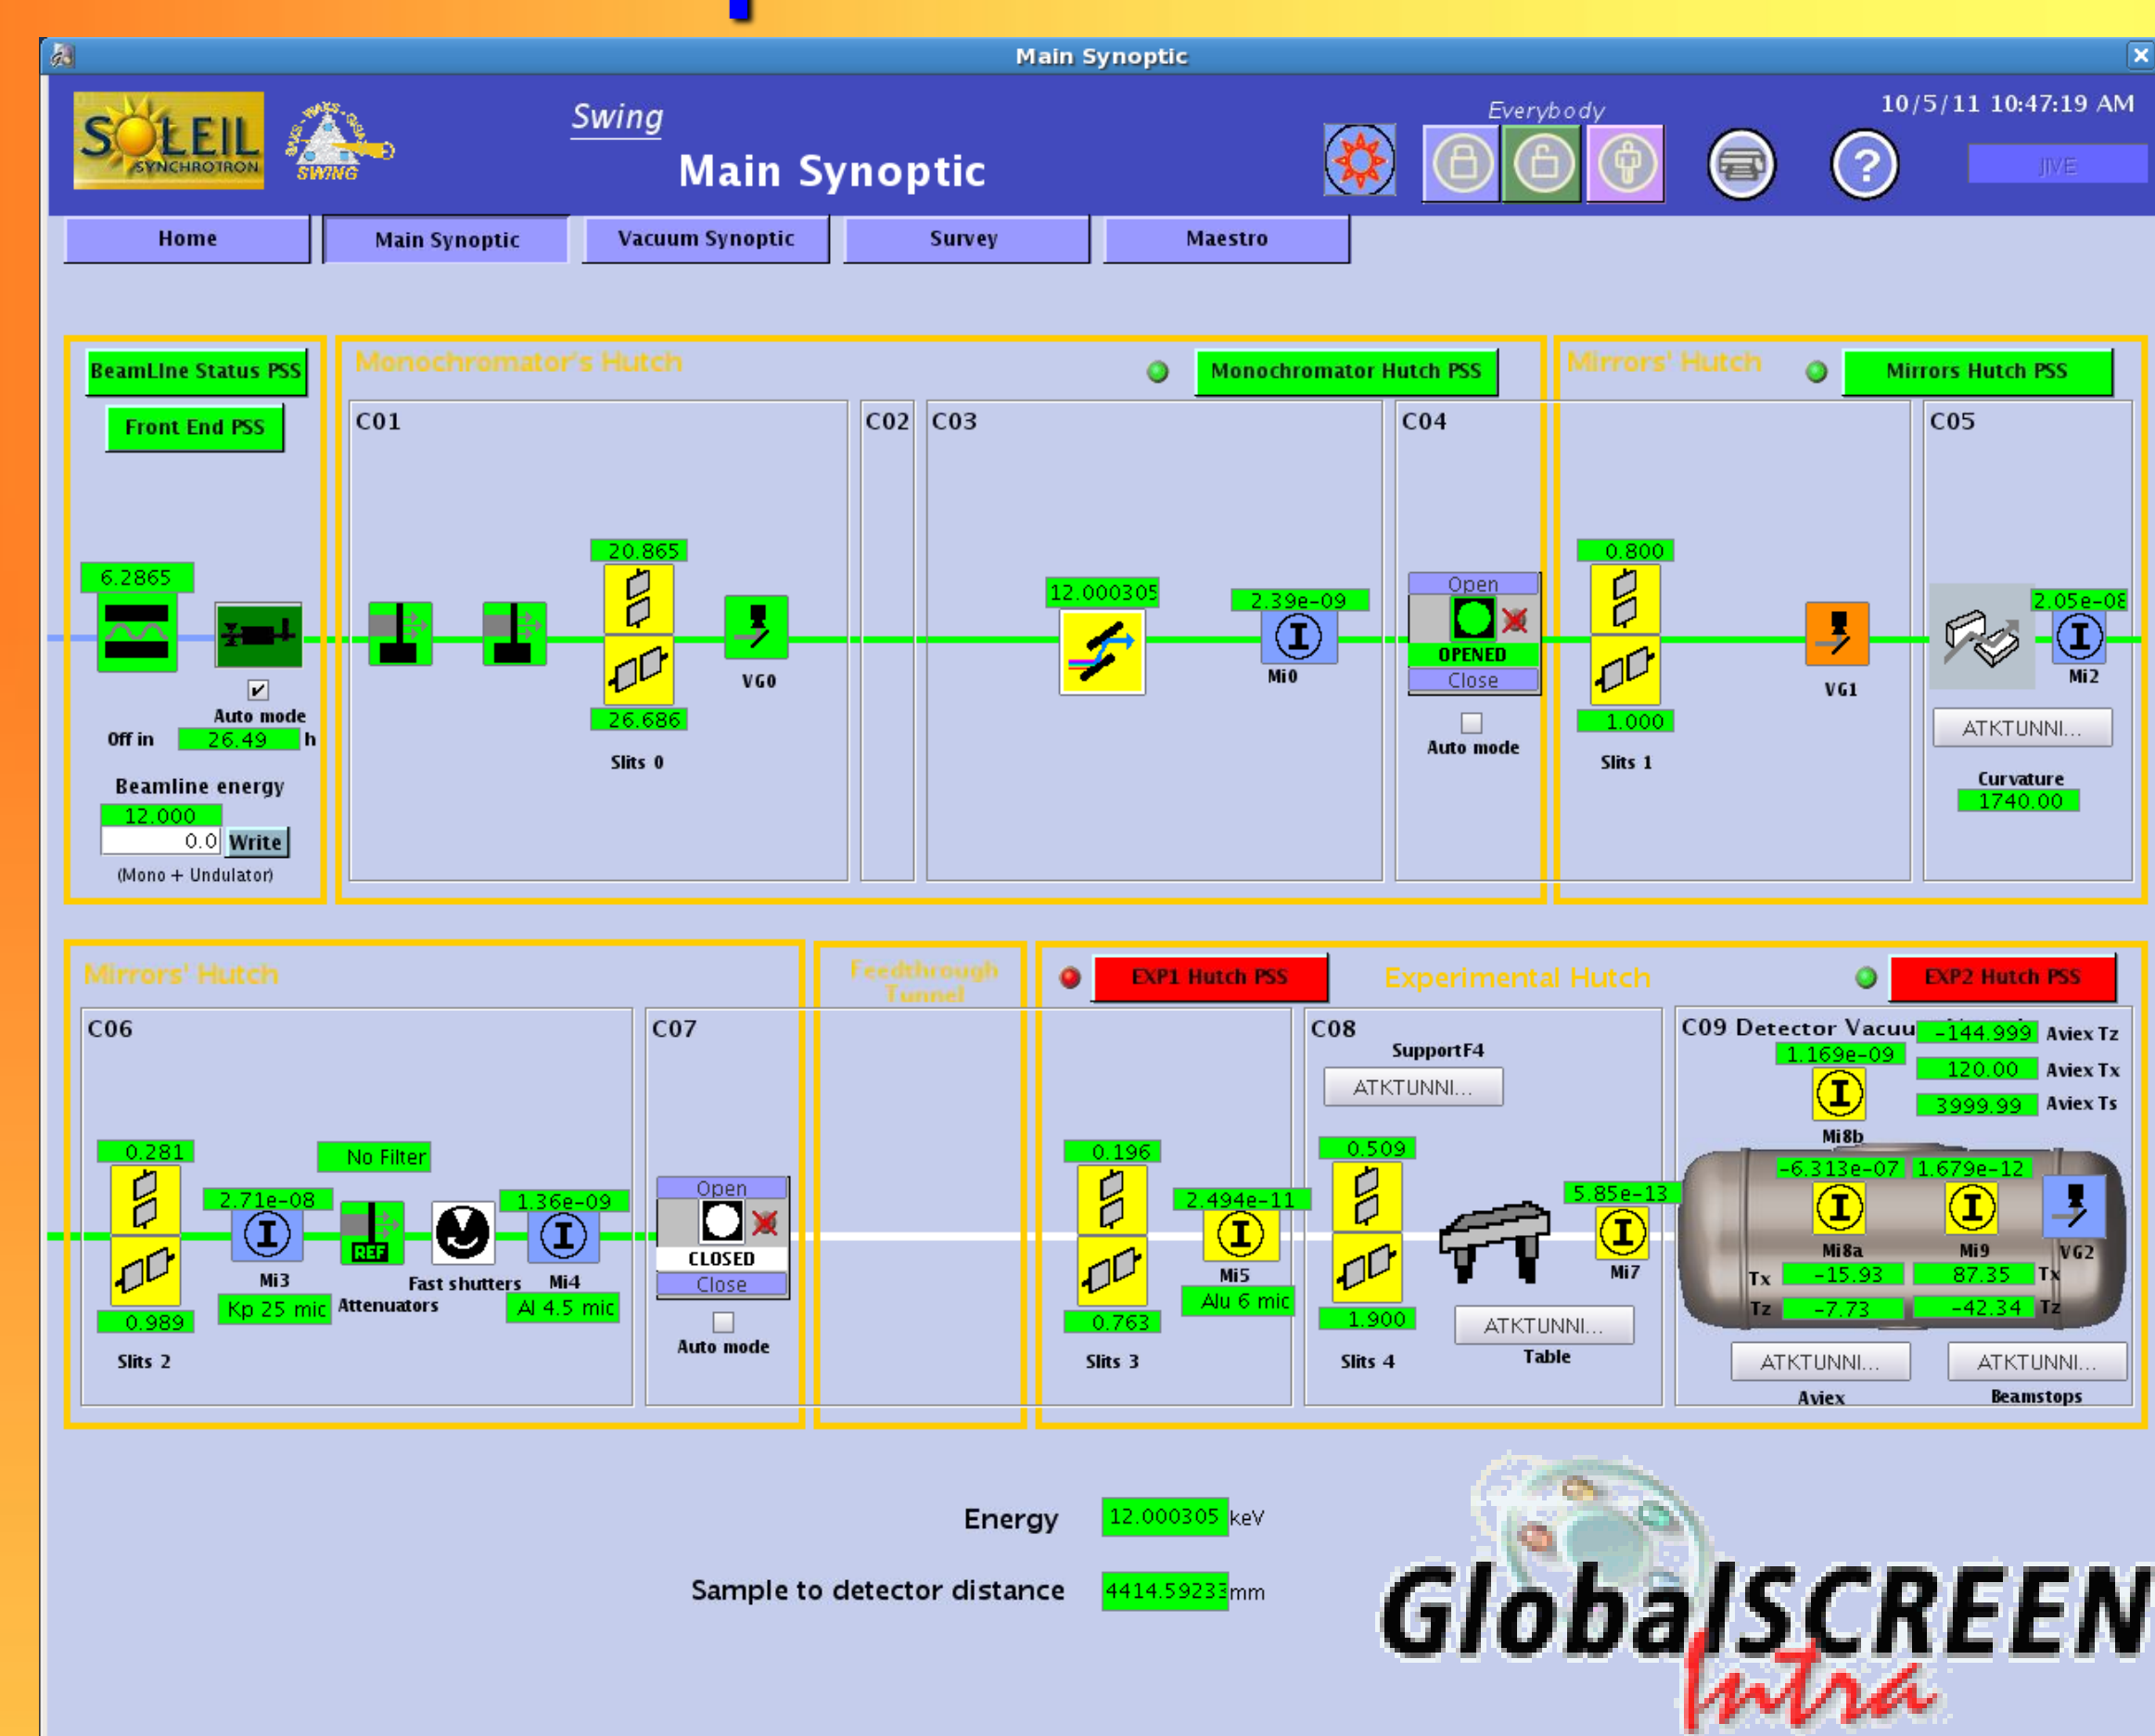

Java Lego
